

In January 2014, USDA announced its intention to soon approve Dow AgroScience's genetically engineered 2,4-D resistant corn and soybeans. Monsanto's dicamba-resistant cotton and soybean are next in line. Approval of these seeds will drive a massive increase in use of the toxic and drift-prone herbicides, causing severe damage to vulnerable crops, driving farms out of business, harming rural families' health, and contributing to even more herbicide-resistant superweeds.

**Sign below to urge USDA to reject Dow and Monsanto's petitions for approval of their 2,4-D and dicamba-resistant seed lines.**
